

Lab 4 — LLM Chat Record

Purpose: Record the use of ChatGPT as the external Vibe-Coding support tool for the student's Missile Command lab.

Student request / direction

The student provided the assigned repository link and requested that the final Lab 4 deliverables be organized into a final Lab 4 folder. The student subsequently requested that the documentation clearly distinguish the student's work from external AI support.

External support provided by ChatGPT

- Reviewed the Lab 4 handout requirements.
- Reviewed the repository README and identified the four requested coding tasks.
- Discussed implementation approaches for the deliberate battery-selection bug and the three feature functions.
- Helped prepare the final implementation report, checklist, and folder structure.
- Flagged the limitation that generated demonstration videos must not be represented as genuine student screen recordings.

Student-owned deliverables

The final repository/code submission, integration of the requested features, organization of the Lab 4 folder, and final submission decisions are treated as the student's deliverables. This document does not invent or claim unrecorded prompts, keystrokes, commits, or testing actions.

Important integrity note

The available chat record is a summarized record rather than a complete chronological transcript. It is therefore not appropriate to manufacture additional conversation turns just to make the AI contribution appear smaller. If the instructor requires the actual exported ChatGPT conversation, the student's genuine export should be submitted.
